

Never Have to Shave, Wax or Pluck Again!

The Fountain offers two different kinds of laser hair removal with the advanced Sciton® Joule Laser System: Yag Laser and Broad Band Light (BBL). The Yag laser can be used on all skin types and colors. The BBL is more suited to those with light skin and dark hair.

The end result of both therapies is the permanent elimination of unwanted body and facial hair! It takes 4 – 6 treatments to ensure the hair does not return. See the details about hair growth in this brochure.

If you have questions, please call. Everyone in our office has had this procedure and can discuss the results and how the procedure is done.

About Hair Growth and Removal...

H... nt

W

Ha... skin.
Laser-light energy is delivered to the area of treatment and the energy is absorbed by the hair follicle. Enough energy is delivered to the hair follicle to cause heat and destroy the root of the hair without causing skin damage.

During the procedure, there is a very faint odor of burned hair as the hair is eliminated.

Every precaution is taken to ensure the treatment is as comfortable and safe as possible. The skin is cooled and numbed with a topical anesthetic in sensitive areas.

How Hair Grows:

There are three phases of hair growth:

- **Anagen Phase:**

The anagen phase of hair growth lasts from 2 to 8 years. This is the “visible” phase of hair growth. Those with a long anagen phase can grow long hair. At any time, 85% of hair is in the anagen phase.

- **Catagen Phase:**

This phase lasts 2- 4 weeks. This is the transition phase where the hair follicle shrinks in size and there is no hair growth.

- **Telogen Phase:**

The telogen phase is the dormant or resting phase. At any one time, about 15% of the hair is in the resting phase. Hair shedding is common during this phase.

If hair grew in “crops” like corn or wheat, we would go bald until a new “crop” of hair regrew. Hair grows in phases in all areas of the body.

Since various hairs are in one of three phases, the anagen phase being the longest, four to six treatments of hair removal are required to eliminate all the “crops” of hair.

Hair in the telogen phase cannot be removed since there is no hair shaft to transmit the laser-light energy to the bulb or root of the hair.

Hair recently “waxed” will not be close enough to the surface to receive the laser-light energy.

The very best preparation is simply to shave the area. After the treatment, some redness may occur and hairs will be “spit” from the skin.
