

The Fountain Age Management and Aesthetics™, LLC is dedicated to providing only the highest quality medical care at a reasonable price.

Pricing is calculated on the number of units of Botox® used in the procedure. The number of units is based on the areas of concern as related by the patient.

You will be given the exact cost and the number of units required during your consultation.

Careful mapping of the muscles of expression is done prior to injection to ensure that the custom result is exactly what is desired. Should the result in a certain area be less than anticipated, during the follow-up visit a week or so later additional Botox® will be injected free of charge to make the adjustment.

There are others who charge less per unit of Botox®, but question them about their results. The results are everything!

About Botox® Cosmetic...

Relaxes wrinkles in a few days to a week.

What is Botox®?

Botox® is a prescription-only drug approved by the FDA for cosmetic use to reduce wrinkles in the face and neck.

How does it work?

The muscles in the body are controlled by nerves. Overly active muscles in the face and

neck along with thinning of the skin with age produce wrinkles.

Botox® is a temporary blocking agent that interferes with the signals from the nerve where it attaches to the muscles in the face and neck. It only affects an area in a one-half inch circle around where it is injected.

With time, the skin wrinkles gradually are filled in by the body since the skin is not being constantly wrinkled by the muscles. For deep wrinkles in the forehead, this can take six months to a year. Botox® **does not** “fill in” wrinkles. It takes several days for the full relaxation effect to be realized.

How long does it last?

Results vary from patient to patient. There is a gradual return of movement in the relaxed area in 2-3 months. Typically 3-4 treatments in a year produce the best results.

Over time, many patients find that treatments last longer each

time Botox® is used. The special post-procedure exercises developed by Dr. Birchall can help the Botox® last longer.

Are there side effects?

No medication including aspirin and vitamins are without any side effects. There can be relaxation or paralysis in areas not wanted, such as a drooping eyelid. This is a rare complication and as mentioned before, Botox® is **not permanent!** The idea is to relax certain areas of the face that are wrinkled – not make the face into a “mask” with no movement.

Is it painful?

Botox® is injected with a miniature needle. If you have a severe phobia of needles, perhaps Botox® is not for you. Ice and numbing cream are available to minimize any pain. As always, we want your procedure to be as safe, comfortable and effective as possible!
